

Example Questions involving Gas Phase Concentrations

1. The National Institute of Occupational Safety and Health's recommended short-term (15 min) exposure limit for benzene (C_6H_6) is reported as 16.3 mg/m^3 , whereas its odour threshold is given 1.5 ppm_v .

a) If a benzene odour is detected, does this necessarily mean you have exceeded the short term exposure limit?

b) Benzene has a reported vapour pressure of 92.5 torr at 25°C . Calculate concentration of benzene in room air, if a large container of benzene was left open in a closed room.

(Note; benzene is a known carcinogen, do not try this at home)

a) $16.3 \frac{\text{mg}}{\text{m}^3} \rightarrow \text{mole fraction (mixing ratio)}$

$$\begin{aligned} \text{mixing ratio} &= \frac{n_{C_6H_6}}{n_{\text{air}}} \leftarrow 16.3 \frac{\text{mg}}{\text{m}^3} \times \frac{1 \text{ mol}}{78.2 \text{ g}} \leftarrow MW_{C_6H_6} = 2.08 \times 10^{-4} \frac{\text{mol}}{\text{m}^3} \\ &\leftarrow \frac{P \cdot V}{R \cdot T} = \frac{(1.00 \text{ atm})(10^3 \text{ L})}{(0.08206 \frac{\text{L} \cdot \text{atm}}{\text{mol} \cdot \text{K}})(298 \text{ K})} = 40.9 \frac{\text{mol}}{\text{m}^3} \\ &= \frac{2.08 \times 10^{-4}}{40.9} = 5.10 \times 10^{-6} \quad \text{or} \quad \boxed{5.10 \text{ ppm}_v} \end{aligned}$$

b) $V.P. = 92.5 \text{ torr} \times \frac{1 \text{ atm}}{760 \text{ torr}} = 0.122 \text{ atm} \leftarrow P_{C_6H_6}$

If there is an inexhaustible supply of C_6H_6 , and if there is enough time for the solution to equilibrate with the room air, then $P_{C_6H_6} = 0.122 \text{ atm}$.

$$\begin{aligned} \text{mixing ratio} &= \frac{n_{C_6H_6}}{n_{\text{air}}} \leftarrow \frac{P_{C_6H_6} \cdot (V/RT)}{P_{\text{air}} \cdot (V/RT)} = \frac{4.98 \times 10^{-3} \text{ mol}}{4.09 \times 10^{-2} \text{ mol}} \\ &= 0.122 \quad (\text{note } \chi_x = P_x/P_T) \end{aligned}$$

$$\begin{aligned} \text{mass/volume} &= \frac{n_{C_6H_6} \cdot MW}{V} = \frac{P \cdot \chi \cdot MW}{R \cdot T} = \frac{P \cdot MW}{RT} \\ &= \frac{(0.122 \text{ atm})(78.2 \text{ g/mol})}{(0.08206 \frac{\text{L} \cdot \text{atm}}{\text{mol} \cdot \text{K}})(298 \text{ K})} = 0.390 \text{ g/L} \quad \text{or} \quad \boxed{390 \text{ g/m}^3} \end{aligned}$$

2. A student prepares a gas standard by injecting 86 mg of chloroform (CHCl_3) into a sealed 2.00L flask, whereupon it completely evaporates. Calculate the concentration of chloroform as ppm_v .

$$\begin{aligned} \text{mixing ratio} &= \frac{n_{\text{CHCl}_3}}{n_{\text{air}}} = \frac{\text{mass/MW}}{PV/RT} \\ &= \frac{86 \text{ mg} \times \frac{1 \text{ mol}}{119.5 \text{ g}} \times \frac{1 \text{ g}}{10^3 \text{ mg}}}{\frac{(1.00 \text{ atm})(2.0 \text{ L})}{(0.08206 \frac{\text{L}\cdot\text{atm}}{\text{mol}\cdot\text{K}})(298 \text{ K})}} \\ &= \frac{7.19 \times 10^{-4}}{0.0818} = 0.008791 \\ &\text{or } \boxed{8790 \text{ ppm}_v} \end{aligned}$$

3. Calculate the number density of oxygen molecules in the atmosphere at an altitude of 30 km (0.015 atm, -40°C).

$$\begin{aligned} n^* &= \frac{\# \text{ molecules}}{\text{cm}^3} \\ n_{\text{O}_2}^* (30 \text{ km}) &= \chi_{\text{O}_2} (30 \text{ km}) \times n_{\text{air}}^* (30 \text{ km}) \\ \text{Taking } \chi_{\text{O}_2} (30 \text{ km}) &= 0.21 \\ \text{and } n_{\text{air}}^* (30 \text{ km}) &= \frac{P \cdot V}{R \cdot T} \times N_A \\ &= \frac{(0.015 \text{ atm})(10^{-3} \text{ L})(6.023 \times 10^{23} \text{ mol}^{-1})}{(0.08206 \frac{\text{L}\cdot\text{atm}}{\text{mol}\cdot\text{K}})(233 \text{ K})} \\ &= 4.72 \times 10^{17} \frac{\text{molecules}}{\text{cm}^3} \\ \therefore n_{\text{O}_2}^* (30 \text{ km}) &= (0.21)(4.72 \times 10^{17} \text{ molecules/cm}^3) \\ &= \boxed{1.0 \times 10^{17} \text{ molecules/cm}^3} \end{aligned}$$

4. The average concentration of sulfur dioxide in Nikel Russia is $50 \mu\text{g}/\text{m}^3$ at. What is the concentration of SO_2 in parts per billion at 15°C and 1 atm.

$$\text{mixing ratio} = \frac{n_{\text{SO}_2}}{n_{\text{air}}} = \frac{50 \mu\text{g}/\text{m}^3 \times \frac{1 \text{ mol}}{64 \text{ g}} \times \frac{1 \text{ g}}{10^6 \mu\text{g}}}{\frac{(1.00 \text{ atm})(10^3 \text{ L})}{(0.08206 \frac{\text{L}\cdot\text{atm}}{\text{mol}\cdot\text{K}})(288 \text{ K})}}$$

$$= \frac{7.81 \times 10^{-7}}{42.3} = 1.8 \times 10^{-8}$$

OR ~~1.8~~ 18 ppbv

5. If the mixing ratio of ozone in polluted urban air is 50 ppbv, calculate its concentration in mg m^{-3} .

$$\frac{\text{mass}}{\text{m}^3} \leftarrow \frac{50 \times 10^{-9} \text{ mols } \text{O}_3}{1 \text{ mol air}} \times \frac{48 \text{ g}}{\text{mol}} \times \frac{10^3 \text{ mg}}{\text{g}} = \frac{0.0024 \text{ mg}}{\text{mol air}}$$

Volume of 1 mol air at $P=1.0 \text{ atm}$, $T=288 \text{ K}$ is given by $V = \frac{nRT}{P}$

$$= \frac{(1.0 \text{ mol})(0.08206 \frac{\text{L}\cdot\text{atm}}{\text{mol}\cdot\text{K}})(288 \text{ K})}{(1.00 \text{ atm})}$$

$$= 23.6 \text{ L or } 0.0236 \text{ m}^3$$

$$\therefore \frac{0.0024 \text{ mg } \text{O}_3}{0.0236 \text{ m}^3} = \boxed{0.10 \text{ mg}/\text{m}^3}$$
