

CHEMISTRY 331 ~ Spring 2008 Environmental Organic Chemistry

This course will examine mechanisms of organic transformations and the fate of molecules of environmental significance. Topics include partitioning, hydrolysis, oxidation-reduction and photolysis. The laboratory emphasizes techniques used in physical organic chemistry, including, kinetics, thermodynamics, linear free energy relationships and adsorption phenomena.

Instructor: Dr. Erik Krogh **Office:** B360-Rm328 **Phone:** 753-3245, local 2307
e-mail: kroghe@mala.bc.ca
http://web.mala.bc.ca/kroggh

Textbook:

Environmental Organic Chemistry, 2nd Ed., R.P. Schwarzenbach, P.M. Gschwend, D.M. Imboden, J Wiley, 2002.

Supplementary Materials (on Course Reserve in Library) :

Reaction Mechanisms in Environmental Organic Chemistry, R.A. Larson, E.J. Weber, Lewis Publishers, 1994.

Illustrated Handbook of Physical-Chemical Properties And Environmental Fate For Organic Chemicals, Volumes 1 – 5, D. Mackay; W.Y. Shiu; K. C. Ma, Lewis Publishers, 1992.

Structure and Reactivity in Organic Chemistry, H. Maskill, Oxford University Press, 1999.

Mechanisms of Organic Reactions, H. Maskill, Oxford University Press, 1996.

Theory and Mechanism in Organic Chemistry, T.H. Lowry; K.S. Richardson, J Wiley, 1987.

Prerequisites: CHEM 232

Recommended: CHEM 221

Course Delivery:

Lectures	M W 1:00 - 2:30	B360, Rm 202
Labs	W 2:30 - 6:30	B360, Rm 201 (alternate weeks)
Tutorials*	F 12:30-1:20	B360-202 (one hour per week)

Course Evaluation:

Final Exam	40%	(three hour final)
Lab	20%	(four formal lab reports @ 5% each)
Mid-Term/s	15%	(mid-February)
Research Poster	15%	(March 24 th)
Assignments	10%	(four assignments @ 2.5% each)

* *Tutorials will be scheduled each week to cover review materials, address assignment and laboratory questions. Attendance is mandatory.*

CHEM 331 - COURSE OUTLINE

ENVIRONMENTAL ORGANIC CHEMISTRY

1. INTRODUCTION AND REVIEW (Chapters 1 and 2)

Classification of organic molecules and review of physical properties including, natural organic matter, halocarbons, phenols, polyaromatic hydrocarbons, organophosphates, surfactants; Review of sources such as agrochemicals, industrial uses, flame retardants and by-products.

2. CHEMICAL DISTRIBUTION IN THE ENVIRONMENT (Chapters 3 – 11 and handouts)

Introduction to the molecular interactions that lead to physical properties that affect chemical distribution in the environment.

2.1 MOLECULAR PARTITIONING (selections from Chapter 3)

Molecular interactions; partition constants; thermodynamic considerations

2.2 VAPOUR PRESSURE (Chapter 4)

Thermodynamic considerations; molecular interactions; effect of temperature; estimation methods

2.3 WATER SOLUBILITY (Chapter 5)

Thermodynamic considerations; activity coefficients; molecular interpretation of excess free energy; effect of temperature and ionic strength; estimation methods; molecular fragment contributions

2.3 AIR- WATER PARTITIONING (Chapter 6)

Thermodynamic considerations; Henry's Law constant; estimation methods

2.4 OCTANOL – WATER PARTITIONING (Chapter 7)

Thermodynamic considerations; linear free energy relationships; estimation methods

2.5 ACID – BASE PARTITIONING (selections from Chapter 8)

Acidity constants; substituent effects; Hammett equation; effect of water solubility

2.6 SORPTION PARTITIONING (selections from Chapters 9 – 11)

Solid – water (K_d) interfaces; sorption to particulate and dissolved organic matter; bioaccumulation; biomagnification; sorption to inorganic surfaces

3. CHEMICAL TRANSFORMATIONS IN THE ENVIRONMENT (Chapters 12 - 16)

Introduction to important reaction classes of organic molecules including substituent effects and structure – activity relationships.

3.1 NUCLEOPHILIC REACTIONS: HYDROLYSIS (Chapter 13)

Functional group transformations including reactions with epoxides, halocarbons, phosphate esters and carboxylic acid derivatives; Mechanisms of hydrolysis reactions; Kinetics, substituent effects and linear free energy relationships (Hammett)

3.2 REDUCTION REACTIONS (Chapter 14)

Mechanisms of reductive transformation pathways including dehalogenation and nitroaromatic reductions; Introduction to electron mediated reductions involving NOM

3.3 OXIDATION REACTIONS (Chapter 14)

Oxidations involving molecular oxygen, superoxide, singlet oxygen and ozone; Oxidations involving hydroxyl radicals and by-products; Reactions with disinfectants, aqueous chlorine

3.4 PHOTOCHEMISTRY (selections from Chapter 15 and 16)

Electromagnetic radiation, chromophores and excited states; photophysics of organic molecules, direct and sensitized photolysis; Photoreactions of selected compounds

4. SPECIAL TOPICS: (selected readings)

Mass balance and dynamic modeling; Estimation methods based on structural group contributions; Remediation strategies including incineration, bioremediation, advanced oxidation and electroreduction

CHEM 331 LABORATORY

The Octanol-Water Partition Co-efficient

Using HPLC retention times to estimate the K_{ow} .

Stir Bar Solvent Extraction Analysis of PAHs in Aqueous Solution

Using a polymer based technique to pre-concentrate polyaromatic hydrocarbons for analysis by GC-MS.

Linear Free Energy: The Hammett Equation

Evaluating the pK_a 's of substituted benzoic acid derivatives by acid-base titration.

Hydrolysis Kinetics of a Carboxylic Acid Ester

Following the rate of reaction for 4-nitrophenyl acetate under neutral and basic conditions using UV-vis absorption.

Photocatalytic Destruction of an Organic Dye Using Titanium Dioxide

Following the photodegradation of Malachite green using UV-vis absorption.

FORMAL LAB REPORTS

Theory: This section will typically be 2 – 3 pages and will introduce the basic concepts of the lab exercise. Some of this background is given in the lab manual, which you may incorporate in your own words. The theory section will typically involve references from one or more of the course texts.

Experimental: Refer to the lab manual except where modifications have been made. Also include specific information about the source (and purity) of chemical reagents used, make and model of specific instruments employed and operating conditions for instrumental methods. Be sure to describe how duties and responsibilities were divided for labs that involved a group effort.

Data: Summarize experimental data in tables wherever possible. Include enough information for the data table to stand alone as a source of information. Be sure to report the source of data if not your own.

Results: Summarize results in tables where possible. Be sure to include sample calculations (if any) and attach spreadsheet calculations and graphs as an appendix.

Discussion: Discuss the significance of your results in the context of the theory section. Your discussion should include references to the primary literature so that you can compare your results to those of others. Address any supplemental questions in your discussion section. The discussion section will typically be 2- 3 pages.

Each lab report will be marked out of **25** and will be evaluated on organization and presentation as well as content. Be sure to cite all references properly using the ACS style of Environmental Science and Technology.
